TAPOLEON

Who is Tapoleon?

Tapoleon is an entity that provides chartist analyses for crypto markets based on a deep technical study of the price for traditional and crypto markets. This is formed by two scalpers with a passion for technical analysis, 4 years of experience in traditional markets such as currencies, stocks and commodities and 1 year in the crypto world.

“TAKE
TIME TO
DELIBERATE,
BUT WHEN
THE TIME
FOR ACTION
COMES,
STOP
THINKING
AND GO IN.”

- Napoleon Bonaparte

Experience

The two traders, with a deep background in economics, got started in trading around 4 years ago. Firstly driven by the stories of how professional traders created their successful career, they started reading everything that fell into their hands related to trading. After several months training with a demo account and joining online classes of trading techniques, their results allowed them to create an account with real money. Then, their career in trading had just started

In the following years he focused on trading currencies, stocks like the German DAX and commodities like oil. It was during the fall of 2017 when, after the incredible rise of cryptocurrencies in the world, they thought that very possibly their trading strategies could be applied to the crypto market. After some months testing it and the change of market conditions in January, they discovered Cryptohopper. This was the first time they tried to automate their trading strategies. Since then, they have been trying to elaborate trading strategies that “don’t rest” and work for them 24/7 with a daily and strict control of them.

CRYPTOHOPPER

It was in March of 2017 when we discovered crypto trading bots. Before paying for that Bunny subscription, now explorer, we thought automated trading was something that only big companies and professional programmers could do. However, this platform gave us the possibility to automate it.

Which services do we offer?

Signals

Tapoleon signals. What is it? This is basically mirror trading. Every position that we will open, will automatically be open by your hopper.

These signals are based on two different strategies that operate in the exchanges Binance, Kraken and Bittrex. These strategies are designed mainly to trade with the most liquid and capitalized coins and are thought to last less than a day in your open positions section, since we operate in small time frames (Scalping). In this way, if you don't have too much money to trade with, it will allow you to rotate that amount in a lot of different trades, continuously adding up profit.

Strategies

Tapoleon strategies are conformed by: The 9 Candles Analysis, Cavalry, The Chaikin Strategy and The Conqueror.

They are highly backtested strategies that we have been manually putting in practice for, at least, 2 months (minimum threshold to test if a strategy is consistent). Each of them trades

in a different context, such as based on volume, volatility or trends, for instance.

These ones work more effectively with the settings created in our free templates. Settings more focused on the short and medium term.

Marketplace: <https://www.cryptohopper.com/marketplace/strategies>

How to set up your hopper?

Configure your hopper taking into account the following aspects:

1. Introduce your API keys.
2. Live bot ON
3. In buy settings: set your maximum amount of open positions, positions per coin and select (or not) cooldown.
4. Coins and amounts: Select an amount for "Percentage buy amount" larger than 20\$, otherwise your exchange won't open any position (below minimum threshold). Same with "Minimum amount per order".
5. Select strategy. It can be made by you or purchased from Marketplace.
6. Choose your selling (close position) settings: Take profit, stop-loss, trailing stop-loss and closing by strategy.

Recommended amounts to invest:

- Explorer: 200 to 500\$
- Adventure: 500 to 1.500\$
- Hero: >1.500\$

Advice/tips for these settings? Tapoleon templates have incorporated the settings that, we think, will work better for current market conditions.

STRATEGIES

The strategies are a combination of technical indicators that trade cryptocurrencies with a specific objective, such as trading based on volume, resistances and supports, trends and volatility.

The strategies have been tested for a minimum period of 2 months to filter out non-consistent ones, then focusing on the ones that give, at least, a ratio profit/loss of 60%/40%.

We seek an average positive trade of 3.3% and an average loss (determined by our stop-loss and closing by strategy) of 3.5%. In this way, with a ratio profit/loss of 60%/40%, we will be adding more crypto to our account at a fixed rate.

Next, we will introduce the 4 different trading strategies we have available now:

1. The Chaikin Strategy
2. 9 Candles Analysis
3. Cavalry
4. The Conqueror

THE CHAIKIN STRATEGY

Description

The Chaikin Strategy, strategy named by the indicator Chaikin oscillator.

This strategy makes use of the Chaikin A/D oscillator amongst other indicators to focus on the volume of the market. This strategy will open positions when the volume and price are going up hand in hand. It buys as soon as there is more volume in the market that is driving the price up.

Closing a position

On the other hand, it will close a position as soon as volume starts decreasing and the price gives signals of weakness.

Trade duration

Our trading strategies are considered Scalping. They are designed to last no more than couple of days. The Chaikin Strategy, since it is based on volume, can last more depending on the volume of the market. For a bull run, the positions will remain open longer since the volume is larger. Then, the duration of these ones might vary from one day up to 4 days if there is a bull run.

Price: 8.99\$

9 CANDLES ANALYSIS

Description

9 Candles Analysis consist of a study of the change and momentum of the most recent candles. Scalping mode activated. This strategy measures the change and momentum of the previous 9 candles with respect to the current price. Positive momentum combined with a very specific change during the last candles is indicative of a trend. Enough to open a position? Not for us. It is combined with another indicator to filter out fake signals.

Closing a position

When it comes to close a position. As I always say, set a Stop-Loss and TSL that depends on the volatility of the market. However, this strategy also closes positions based on strategy. The closing strategy will sell as soon as the market shows signals of reversal. Therefore, closing the position with the highest percentage.

Trade duration

The candle size of this strategy ranges from 30 minutes to one hour. It will track the momentum of the price and other strength indicators to open a position in a small time interval and close it as soon as the price show reversal signals. The average duration is less than a day.

CAVALRY

Description

Cavalry, intended to gallop trends with security.

Purely a trend trader. Perfect fit for markets trending in with one to two-hour candles. Even if the market is ranging, this one will be able to trade on this one with security. The Parabolic SAR combined with two more indicators in different time frames will filter out fake signals.

Closing a position

Set a stop-loss and TSL that depends on the volatility of the market. However, this strategy will close most of the positions based on strategy. The closing strategy will sell as soon as the market shows signals of reversal. Therefore, closing the position with the highest percentage.

Trade duration

This trend strategy is designed to trade short- and medium-term trends. The positions will be closed as soon as the trends show signals of weakness. Its average trade duration is less than a day, unless there a bull run takes place, since the trend will be longer.

Price: 24.99\$

CAVALRY

THE CONQUEROR

Description

The conqueror, our master strategy.

The technical analysis behind this strategy separates the strength of the bearish and bullish trends of the price and combines it with different quick moving averages to filter out weak signals. Therefore, identifying when the demand is more present in the market altogether with the beginning of a trend, which will be spotted by quick and normal moving averaged. In this way, every buy of this strategy will be a strong signal. This strategy has been the best performing one amongst all the tested ones. It has shown profit, mostly in bullish and sideways markets. However, in bear markets it will not trade as frequently as in other market conditions since the supply will be more present than the demand.

Trade duration

Its candle size ranges from 30 mins for one indicator and 1 hour for other ones. Average open position duration of one to two days.

Closing a position

Regarding closing a position, I recommend setting a TSL with a percentage of 0.8% to 1.5%, depending on the current volatility of the market. More volatility larger percentage. Always set a Stop-Loss. Before opening a position, you must clearly know how much you are willing to lose. Don't let your hopper to hold big bags that have a huge opportunity cost.
